==========

YouGov interviewed 5082 respondents pre and post the 2024 election across the states of Arizona (1286), Colorado (1187), Nevada (615), New Mexico (664), and Utah (618), in addition to an oversample of 715 Hispanic respondents. First the Hispanic oversample was matched down to 600 observations (300 before and after the election), matched to a sampling frame on gender, age, race, and education. The sampling frame is a politically representative "modeled frame" of Hispanic US adults, based upon the American Community Survey (ACS) public use microdata file, public voter file records, the 2020 Current Population Survey (CPS) Voting and Registration supplements, the 2020 National Election Pool (NEP) exit poll, and the 2020 CES surveys, including demographics and 2020 presidential vote.

The matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, years of education, and state. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles.

The weights were then post-stratified on 2020 presidential vote choice as well as a four-way stratification of gender, age (4-categories), race (4-categories), and education (4-categories), to produce the Hispanic over sample weight.

We next proceeded to match down samples by state -- initially excluding the Hispanic oversample results -- with 1100 for Arizona (550 before/after), 1000 for Colorado (500 before/after), 450 for Nevada (225 before/after), 400 for New Mexico (200 before/after), and 450 for Utah (225 before/after). The respondents were matched to a sampling frame on gender, age, race, and education by state. The sampling frame is a politically representative "modeled frame" of US adults within these states, based upon the American Community Survey (ACS) public use microdata file, public voter file records, the 2020 Current Population Survey (CPS) Voting and Registration supplements, the 2020 National Election Pool (NEP) exit poll, and the 2020 CES surveys, including demographics and 2020 presidential vote.

The matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, years of education, and home ownership. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles.

The weights were then post-stratified on 2020 presidential vote choice, 2024 presidential vote choice, as well as a four-way stratification of gender, age (4-categories), race (4-categories), and education (4-categories), to produce the initial weights by state.

Upon acquiring the initial weights by state, the respective Latino oversample observations were added into their respective states. These aggregated state frames were then post stratified by the Hispanic proportion of the population within these states, as determined via the sampling frame to produce the final weights by state.

Finally, all of the state observations were aggregated, with results weighted by the proportion of the state's population within the sampling frame, to produce a final single aggregated weight for the final 4000 observations.
